Product Information
Air-Volume Control

Air-Volume Control VAV
Compact

Products no longer available
VAV-Compact NMV-D2

Pressure sensor, controller and 8 Nm damper actuator as a compact unit

Control input modulating:
DC 2...10 V, DC 0...10 V

Override control functions:
«CLOSE», \( V_{	ext{MIN}} \), \( V_{ZS} \), \( V_{	ext{MAX}} \) «OPEN»

Communication capacity (PP)

Application

The VAV-Compact NMV-D2 is used for pressure-independent air flow control of VAV Boxes. It is controlled by modulating signals from positioners, master controllers or DDC systems. Various modes of operation in the form of overrides can be obtained very simply by the application of AC signals.

Construction

The VAV-Compact NMV-D2 circuit contains a dynamic differential-pressure sensor and an electronic measuring and control unit incorporating a microprocessor. The equipment unit is based on the proven type NM damper actuator.

Operation and adjustment

The gearing can be disengaged by pressing the pushbutton on the actuator housing. The damper can be operated by hand while the button is held depressed. Apart from this release pushbutton there are no other operating controls such as switches or reference potentiometers on the NMV-D2 unit.

The programming of operating modes and operating parameters \( V_{	ext{MIN}}, V_{	ext{MAX}} \) and \( V_{	ext{DOM}} \) is performed with one of the PP accessory devices ZEV, ZEVO.

Electrical accessories

ZEV Adjuster

ZEVO (for checks and adjustments one-site)

ZEVO (for OEM programming)

The advantages of PP programming are:

- Remote parameter setting and control of actual-value capabilities
- No risk of mistakes by untrained or unauthorized persons.

Technical data

Nominal voltage AC 24 V 50/60 Hz, DC 24 V
Nominal voltage range AC 19.2...28.8 V, DC 21.6...26.4 V
Power consumption 3 W
For wire sizing 5.5 VA
Reference value w Input resistance DC 0...10 V (reference in the range between \( V_{	ext{MIN}} \) and \( V_{	ext{MAX}} \)) min. 50 kΩ
Operating mode control z Override control for «CLOSE», \( V_{	ext{MIN}}, V_{ZS}, V_{	ext{MAX}} \) and «OPEN» (specific application of AC power signals)

Working range optional «2...10 V» = DC 2...10 V for \( V_{	ext{MIN}}, V_{	ext{MAX}} \)
«0...10 V» = DC 0...10 V for \( V_{	ext{MIN}}, V_{	ext{MAX}} \)

Actual-value signal for volumetric flow \( U_5 \):
DC 2...10 V @ 0.6 mA (for mode 2...10)
DC 0...10 V @ 0.6 mA (for mode 0...10)
Signals linear, correspond to 0...100% \( V_{	ext{DOM}} \)

Sensor range 2... = 300 Pa (OEM dependent)
Connecting cable 1 m, 4 x ø0.75 mm²
Direction of rotation L/R selected with ZEVO or PC (OEM setting)
Protection class III (safety extra-low voltage)
Degree of protection IP42
Angle of rotation max. 95°, adjustable by mechanical stops
Torque at rated voltage min. 8 Nm
Position indication mechanical with pointer
Ambient temperature range 0...+50°C
Storage temperature range -20...+80°C
Humidity test to EN 60335-1
EMC CE according to 89/336/EEC and 92/31/EEC
Sound power level max. 35 dB (A)
Maintenance maintenance-free
Weight 900 g

User-friendly – modulating control and overrides for the NMV-D2

If an HVAC system is to be user-friendly it must be possible to employ multi-step control with constant volumetric flow rates as well as modulating control of the air volume controller by means of DC signals.

In the case of VAV Compact controllers, either method is very easy to employ. The reference variable input $w(3)$ responds both to modulating signals and to override signals derived from the AC power supply. This ensures that several units connected in parallel can also be used in combination with VRD2... controllers.

For technical reasons, «CLOSE» override control is only possible in the 2...10 V DC working range or generally when $V_{\text{MIN}}$ is set to 0%.

Damper «CLOSE»

Energy can be saved in unoccupied zones or rooms by closing the supply-air and exhaust-air dampers.

Shorting input $w$ to connection 1 in the 2...10 V working range causes the NMV-D2 to move the damper to the closed position. The actuator is also forced to close the damper when the setpoint for minimum volumetric flow $V_{\text{MIN}}$ is set to 0% and the control signal corresponds to the $V_{\text{MIN}}$ value.

$V_{\text{MIN}}$ – minimum volumetric flow

Specific zones or rooms in a building can be switched to standby mode if they are unoccupied or if this is necessary for some other reason. It produces a substantial reduction in energy consumption thanks to the minimum amount of air supplied to the zones or rooms in question.

$V_{\text{ZS}}$ – intermediate stage

In manual or automatic multi-step volumetric flow control, finer adjustments – of, say, air quality – can be achieved by using the mean value of maximum and minimum flow.

$V_{\text{MAX}}$ – maximum volumetric flow

Individual rooms or groups of rooms can be supplied with maximum air flow for short periods. It is ideal for providing scavenge-ventilation, night-cooling and morning warm-up.

Damper «OPEN»

For additional smoke extraction or as an extra safety position. Volumetric flow control is inoperative in this case and the damper is driven to the «mechanical» open position.

Modulating control

Depending on the modulated reference signal and the selected working range (2...10 V or 0...10 V), the NMV-D2 regulates the flow between the two set values of $V_{\text{MIN}}$ and $V_{\text{MAX}}$.

The diagrams show the Belimo standard settings. OEM’s can reprogram these settings by PC when necessary.

Examples of connecting for adjuster ZEV to the NMV-D2
A service tool for commissioning, maintenance and testing

Application
The ZEV adjuster can be used by commissioning engineers and service mechanics for checking actual values and operating status in HVAC systems and also for making simple adjustments.

The NMV-D2 has no operating controls such as switches or setpoint potentiometers so the microprocessor-controlled ZEV adjuster is essential for programming the operating parameters $V_{\text{max}}$, $V_{\text{min}}$, and the working range.

Construction and operation
The ZEV adjuster is easy to use and requires no knowledge of computers. The operating controls are on the front of the device. The settings are entered in the same way as with the VRD controller. The working ranges $2...10$, $0...10$ and the $V_{\text{max}}$ and $V_{\text{min}}$ values are set by means of individual potentiometers. The controller can be made to accept the settings by briefly pressing the appropriate «set» key after the required values have been entered on the ZEV adjuster. The settings are acknowledged by the lighting-up of the appropriate LED. Pressing the «reset» key returns the controller to the original OEM factory settings for $V_{\text{max}}$ and $V_{\text{min}}$. A green LED indicates the status of the control circuit. Completed = steady, Uncompleted = flashing.

Connections
The electrical connections between the ZEV adjuster and the NMV-D2 or the VRD2(-L) unit can be made either locally or remotely, e.g. at the equipment cubicle via the PP connection.

Note: As long as the U/PP connection of the NMV-D2 / VRD2 is connected to the ZEV Adjuster, the output signal $U_5$ will not represent the current actual value. However, communication can be interrupted through appropriate use of the «mode» key.

Technical data ZEV

| Nominal voltage | AC 24 V / 50/60 Hz, DC 24 V |
| Nominal voltage range | AC 19.2...28.8 V, DC 21.6...26.4 V |
| Power consumption | 1 W |
| PP-communication | DC 1.0/12.5 V max. DC 15 V bi-directional 1200 Baud |
| Actual-value checking | $V_{\text{max}}$, $V_{\text{min}}$, operating modes |
| Control circuit checking | Actual-value ≠ Setpoint (green LED flashing) |
| OEM original values | $V_{\text{max}}$, $V_{\text{min}}$ (can be reactivated with the reset button) |
| Adjusting range $V_{\text{max}}$ | 30...100% $V_{\text{NOM}}$ |
| Adjusting range $V_{\text{min}}$ | 0...80% $V_{\text{max}}$ (for constant control...100%) |
| Working range optional (mode) | $2...10 = \text{DC } 2...10 \text{ V } (V_{\text{max}}...V_{\text{min}})$, $0...10 = \text{DC } 0...10 \text{ V } (V_{\text{max}}...V_{\text{min}})$ |
| Connection | Screw terminals 2 x 1.5 mm² |
| Protection class | III (safety extra-low voltage) |
| Degree of protection | IP42 |
| Ambient temperature range | 0...+50 °C |
| Storage temperature range | −20...+80 °C |
| Humidity test | to EN 60335-1 |
| EMC | CE according to 89/336/EEC and 92/31/EEC |
| Weight | 500 g |

Dimensions

[Diagram showing dimensions and connections]
Nominal value of volumetric flow $V_{\text{NOM}}$

Energy and noise considerations dictate that the specific value of volumetric flow for each diameter of duct must not exceed a given value.

With BELIMO VAV-Control, the manufacturer can calibrate his air volume controllers at the factory to a maximum value of $V_{\text{NOM}}$. This then produces the very versatile, linear control unit for volumetric flow.

The presetting of units to a uniform value of $V_{\text{NOM}}$ reduces and simplifies the OEM’s work in connection with planning, fabrication, installation and commissioning. Costs are cut substantially as a result.

Operating values of volumetric flow $V_{\text{MIN}}$ and $V_{\text{MAX}}$

The linear characteristic of the air volume controller makes for simple setting of the plant-side operating values of volumetric flow by means of two potentiometers. The adjustments can be carried out either at the factory (OEM) or during installation or commissioning.

The $V_{\text{MAX}}$ value is the upper limit value related to the nominal value of volumetric flow. The $V_{\text{MIN}}$ value can be adjusted as a percentage of the set value of $V_{\text{MAX}}$.

The actual-value output $U_5$ is unaffected by the $V_{\text{MIN}}$ and $V_{\text{MAX}}$ settings.

The reference signals $w/z$ allow the set value of volumetric flow to be adjusted either steplessly or in steps between the preset limit values.

Modes of operation

Multistep-constant mode by overrides:
The controller can be set for several different types of operation when necessary by means of simple override control signals. As a result, it either maintains a constant volumetric flow for $V_{\text{MIN}}$ or $V_{\text{MAX}}$ or an intermediate value by opening or closing the damper according to the control signal.

Modulating:
The flow can be regulated steplessly between the limit values $V_{\text{MIN}}$ and $V_{\text{MAX}}$ by means of the reference signal $w$ (DC 0...10 V). The effective working range DC 2...10 V or DC 0...10 V can be selected as required. The override control functions are also operative in the modulating mode and so can be used in almost any combination.

Operating controls for mode and parameter setting

The NMV-D2 has no operating controls apart from the gearing release push-button.

The specific operating parameters $V_{\text{MIN}}$ and $V_{\text{MAX}}$ and the working ranges are set and selected by means of the ZEV adjuster via the PP communications interface $U_5$.
